

ABSTRACT OF THE DISCLOSURE

In a mouse connected to a personal computer, a casing body is provided with a space for housing a data storage medium therein. A data processor communicates data between the personal computer and the data storage medium housed in the casing body. A door member covers an opening formed on the casing body, through which the data storage medium is attached or detached, in a closed position thereof. The door member constitutes a part of an outer face of the casing body at the closed position thereof.
